

3. REQUIREMENT ANALYSIS PHASE

3.1 Customer Journey Map

- Customer/Policyholder problem identification
- User registration/login
- Insurance policy selection
- Required details submission
- Policy booking/purchase submission
- Policy confirmation
- Policy/claim status tracking
- Claim submission
- Claim verification and processing
- Claim settlement
- Feedback/confirmation

3.2 Solution Requirements:

Functional Requirements

- The system should allow customers to register and securely log in.
- The system should store and manage customer details.
- The system should support multiple insurance policies such as Health, Motor, Life, and Property Insurance.
- Customers should be able to select and purchase suitable insurance policies.
- The system should maintain premium and payment details.
- Customers should be able to submit insurance claims with required documents.

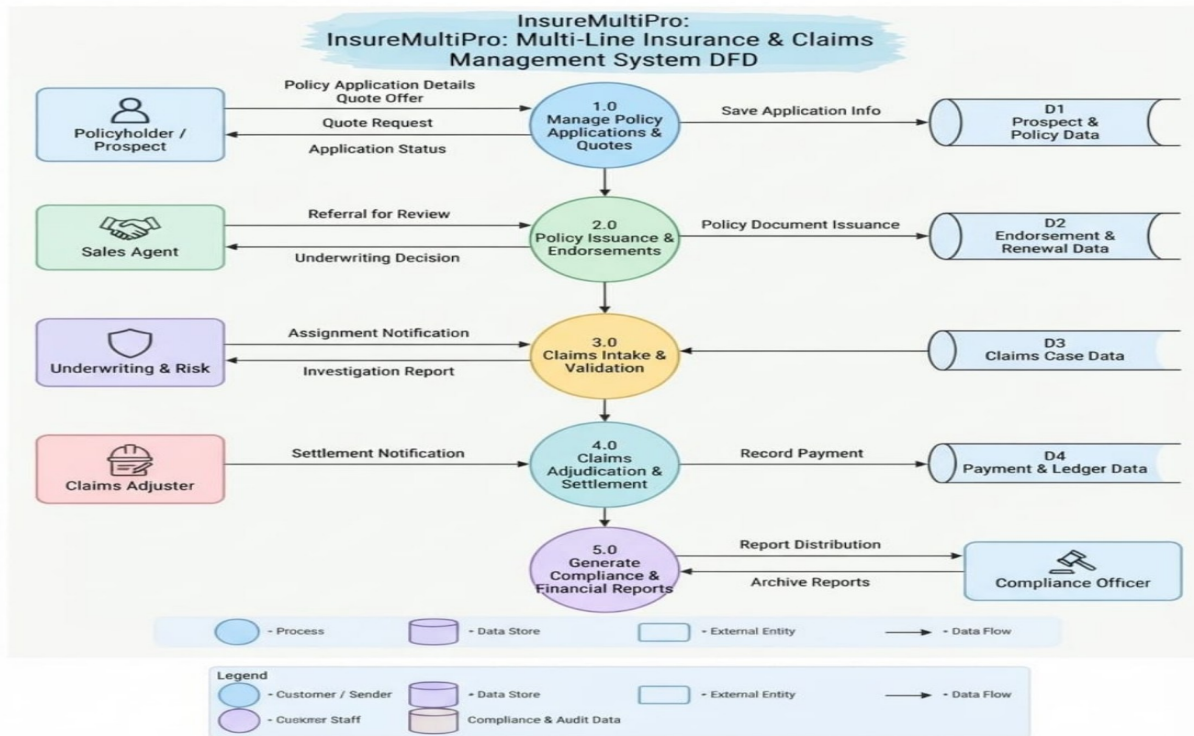

Non-Functional Requirements

- The system should provide secure access to customer and insurance information.
- The system should respond quickly to user requests.
- The system should maintain accurate and reliable data.
- The system should be available to authorized users whenever required.
- The system should have a simple and user-friendly interface.
- The system should support an increasing number of customers, policies, and claims.

3.3 Data Flow Diagram:

Database stores and retrieves all relevant Customer, Policy, Payment and Claim information throughout the process.

Customer → Registration/Login → Policy Selection → Policy Booking → Payment → Policy Confirmation → Policy Tracking → Claim Submission → Claim Verification → Claim Approval/ Rejection → Claim Settlement → Customer

3.4 Technology Stack

Layer	Technology
Presentation Layer	Provides the user interface for customers, agents and administrators.
Application Layer	Handles insurance policy and claims-related application functions.
Business Logic Layer	Processes policy, premium, claim verification and settlement operations.

API Layer	Enables communication between frontend and backend services.
Database Layer	Stores customer, policy, payment, claim and document information.
Authentication & Security Layer	Provides secure login and controls authorized access.
Testing Layer	Used to test and validate APIs and system functionality.
Version Control Layer	Maintains and manages the project source code.
